  - Non-linear PDEs

# Partial Differential Equations

- **Partial Differential Equation (PDE)**

- An equation stating a relationship between a function of two or more **independent** variables and the partial derivatives of this function with respect to these **independent** variables.

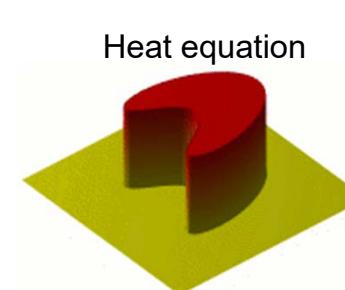

Non linear의 대표적인 예  
속도가 빠르면 빠르게,  
느리면 느리게  
하는 wave equation

→  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$  : 2D Laplace equation  
✓ ( $\rightarrow u_{xx} + u_{yy} = 0$ )

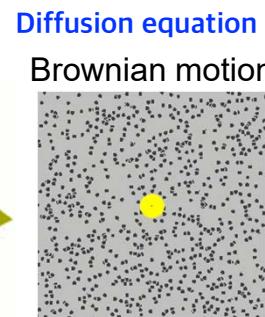

→  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$  : 2D Poisson equation  
✓ ( $\rightarrow u_{xx} + u_{yy} = f$ )

→  $\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$  : 1D Diffusion equation  
✓ ( $\rightarrow u_t = c^2 u_{xx}$ )

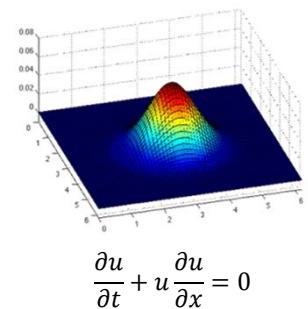

→  $\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$  : 1D Wave equation  
✓ ( $\rightarrow u_{tt} = c^2 u_{xx}$ ) 이 경우는 일정한 속도와 방향으로 움직임

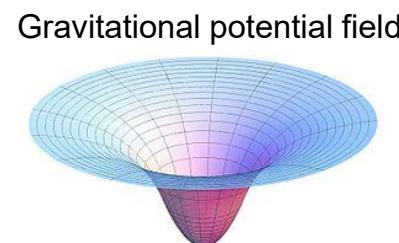

$$\frac{\partial T}{\partial t} = \alpha \Delta T$$

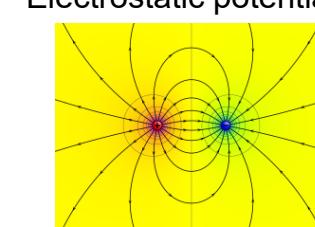

$$\frac{\partial \rho}{\partial t} = D \Delta \rho$$

$$\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} = 0$$

$$\Delta \Phi = 4\pi G \rho$$

$$\Delta V = -\frac{\rho}{\epsilon_0}$$

<https://en.wikipedia.org/wiki/>

# Partial Differential Equations

- **Solution and linearity(or nonlinearity) of PDEs**

- The solution of a PDE in some region  $R$  of the domain of interest,  $D(\vec{x}, t)$ 
  - the particular function,  $u(\vec{x}, t)$  satisfies the PDE in  $R$ ,
  - and the initial and/or boundary conditions specified on the boundaries of  $R \subset D$ .

평균에 대해서는 보장을 받을 수 있음 (analysis 가능)

initial을 무조건 정확히 알아야 한다는 것이 아님! 여러번의 trial을 해야함

- Linear PDE

<https://m.blog.naver.com/pmw9440/221442252220>

- All partial derivatives appear in a linear form (first degree in the unknown function  $u$  and its derivatives)
- “AND” none of the coefficients depend on the dependent variable

$$u_{xx} + u_{yy} = 0, \quad u_t = c^2 u_{xx}, \quad au_t + bxu_x = 0$$

- Nonlinear PDE

- The derivatives appear in a nonlinear form
- “OR” the coefficients depend on the dependent variable

$$uu_x + bu_y = 0, \quad au_x^2 + bu_y$$

Variable coefficient linear PDE  
depends on “independent” variable

# Partial Differential Equations

- **Order of PDE**

- The highest-order derivative

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial u}{\partial y} = 0 \rightarrow 2^{nd} \text{ order}$$

- **Homogeneous vs Nonhomogeneous**

- Homogeneous PDE

→ each of the terms contains  $u$  or the dependent variables or its partial derivatives.

$$u_{xx} + u_{yy} = 0$$

$$uu_x + bu_y = 0$$

$$au_x^2 + bu_y^2 = 0$$

- Nonhomogeneous PDE

$$\nabla^2 u = u_{xx} + u_{yy} + u_{zz} = f(x, y, z)$$

# Partial Differential Equations

- Classification of PDEs using characteristics analysis

→ Consider the general quasilinear 2<sup>nd</sup> order nonhomogeneous PDE in 2D:

$$Au_{xx} + Bu_{xy} + Cu_{yy} = F(x, y, u, u_x, u_y)$$

에너지가 많다면, 온 사방에 균일하게 나눠줌  
모래성이 사라지는 그림 생각하면 좋아  
모양이 포물선 같아서!

Quasilinear : linear in the highest-order derivative

- Parabolic equation ( $B^2 - 4AC = 0$ )

$$\frac{\partial u}{\partial t} = c^2 \nabla^2 u : \text{Diffusion equation}$$

- Hyperbolic equation ( $B^2 - 4AC > 0$ )

$$\frac{\partial^2 u}{\partial t^2} = c^2 \nabla^2 u : \text{Wave equation}$$

- Elliptic equations ( $B^2 - 4AC < 0$ )

$$\begin{cases} \nabla^2 u = 0 \\ \nabla^2 u = f(\vec{x}) \end{cases}$$

: Laplace equation (homogeneous) and Poisson equation (nonhomogeneous)

Heat equation의 steady stationary condition이면 laplace eq.

→ 시간에 대한 요소가 없음

→ diffusion eq. solution이 변하지 않을 때까지 가는 것 (time scale이 없어)

파도가 쳐서 오는 모양!

$u(x, t)$ 을  $y$ 라는 식을 써서 평행이동 해버리자

$t$ 축과  $x$ 축이 있을 때, 매개체가  $c$ : 속도

$c$ 에  $t$ 를 곱하면 간 거리가 되니,  $y = x - ct$ 로 하면 1변수로 바뀜

$u(x, t) \Rightarrow f(x-ct) + f(x+ct)$  : solution이 dependent함

# Partial Differential Equations

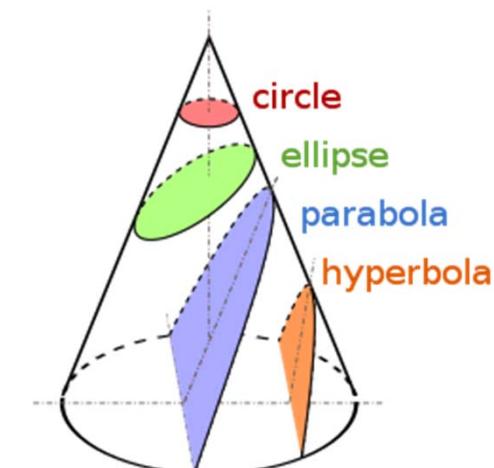

- Classification of PDEs using characteristics analysis

- The terminology **elliptic**, **parabolic**, and **hyperbolic** chosen to classify PDEs reflects the analogy between the form of the discriminant  $B^2 - 4AC$ 
  - (from the idea of d'Alembert's solution, methods of **characteristics**)
  - And that which classifies **conic section**.

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

$$Au_{xx} + Bu_{xy} + Cu_{yy} = F(x, y, u, u_x, u_y)$$

Type	Defining condition	Examples
Parabolic	$B^2 - 4AC = 0$	Diffusion equation
Hyperbolic	$B^2 - 4AC > 0$	Wave equation
Elliptic	$B^2 - 4AC < 0$	Laplace/Poisson equation

<https://en.wikipedia.org/wiki/>

# Partial Differential Equations

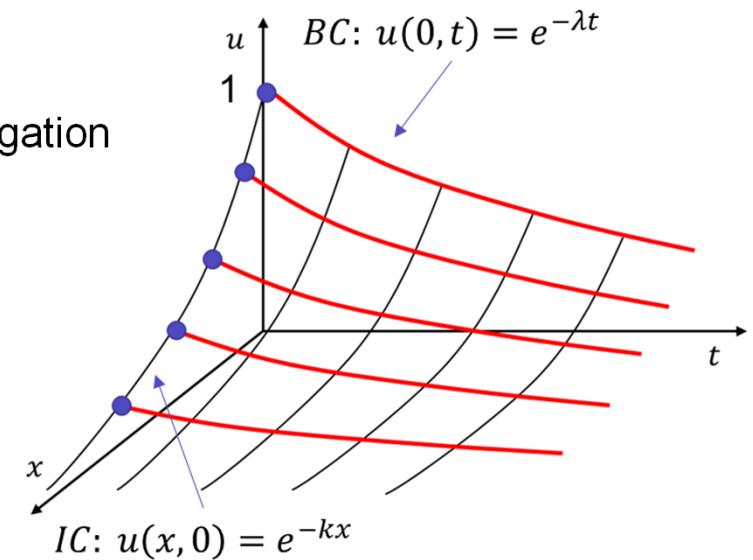

- Classification of PDEs using characteristics analysis

- Characteristics

- Propagate behavior of each fixed point on the space at the “Hyper” space(( $n + 1$ )D space for ( $n$ )D PDE)
- Information,  $u$  (velocity, temperature, pressure etc.) propagates along path.

- Are there any points in the solution domain  $D(x, y)$  passing through a general point  $P$  along which the second derivatives of  $u(x, y)$  are multivalued or discontinuous (kernel space)?

- Homogeneous solution
- If there are such paths, they are called path of information propagation
- Or Characteristics

$Au_{xx} + Bu_{xy} + Cu_{yy} = F(x, y, u, u_x, u_y)$		
Type	Defining condition	Examples
Parabolic	$B^2 - 4AC = 0$	Diffusion equation
Hyperbolic	$B^2 - 4AC > 0$	Wave equation
Elliptic	$B^2 - 4AC < 0$	Laplace/Poisson equation

# Partial Differential Equations

- Classification of PDEs using characteristics analysis

- Chain rule & Homogeneous solution (Kernel space)

$$d(u_x) = u_{xx}dx + u_{xy}dy$$

$$d(u_y) = u_{yx}dx + u_{yy}dy$$

$$\begin{bmatrix} A & B & C \\ dx & dy & \\ dx & dx & dy \end{bmatrix} \begin{bmatrix} u_{xx} \\ u_{xy} \\ u_{yy} \end{bmatrix} = \begin{bmatrix} F \\ d(u_x) \\ d(u_y) \end{bmatrix} \Rightarrow \det \begin{bmatrix} A & B & C \\ dx & dy & \\ dx & dx & dy \end{bmatrix} = 0$$

$$\Rightarrow A(dy)^2 - B(dx)(dy) + C(dx)^2 = 0$$

$$\frac{dy}{dx} = \frac{B \pm \sqrt{B^2 - 4AC}}{2A} \Rightarrow$$

Discriminant	Characteristics	Type
$B^2 - 4AC = 0$	Real & Repeated	Parabolic
$B^2 - 4AC > 0$	Real & Distinct	Hyperbolic
$B^2 - 4AC < 0$	Complex	Elliptic

# Partial Differential Equations

Discriminant	Characteristics	Type
$B^2 - 4AC = 0$	Real & Repeated	Parabolic
$B^2 - 4AC > 0$	Real & Distinct	Hyperbolic
$B^2 - 4AC < 0$	Complex	Elliptic

- Classification of PDEs using characteristics analysis

- Parabolic PDEs have one real repeated characteristic path (Critical damping, diffusing)
- Hyperbolic PDEs of two real distinct characteristic paths (Overdamping, diffusing)
- Elliptic PDEs have no real characteristic paths (Oscillatory)

# One-dimensional PDEs

- **1D Heat equation**

- Semi-discretization
- Temporal discretization
- Stability analysis
  - Eigenvalue/Eigenvector analysis
  - Modified wavenumber analysis
  - von Neumann analysis
- Accuracy via modified equation
- Example 1

- **1D Wave equation**

- Semi-discretization
- Stability analysis
  - Modified wavenumber analysis
- Example 2

Full로 하려니 너무 써야하는게 많아..!!

# 1D Heat equation

- **Semi-discretization - Solving a PDE as a system of ODEs**

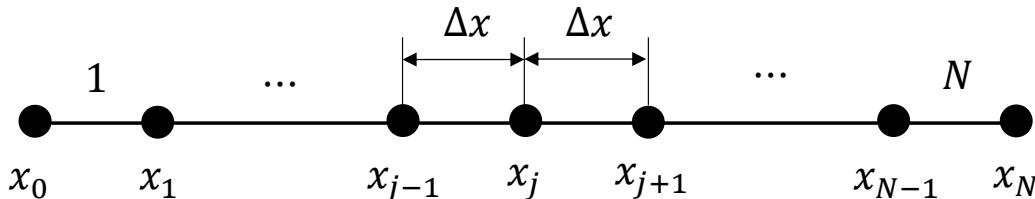

- Numerical methods for PDEs are straightforward extensions of methods developed for initial and boundary value problems in ODEs.
- That is, a PDE can be converted to a system of ODEs by using finite difference methods for the derivatives in all but one of dimensions.
- Consider the one-dimensional diffusion(or heat equation)

$$\frac{\partial \phi}{\partial t} = \alpha \frac{\partial^2 \phi}{\partial x^2}$$

Initial condition :  $\phi(x, 0) = g(x)$

Boundary condition :  $\phi(0, t) = \phi(L, t) = 0$

- Discretization of the Domain with  $N$  intervals  $\rightarrow N + 1$  uniformly spaced grid points

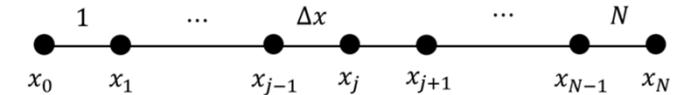

$$x_j = x_{j-1} + \Delta x$$

$j = 0, j = N$  are the boundaries

$j = 1, 2, 3, \dots, N - 1$  are interior points

공간차분 먼저 ( $x(j)$ 시점)

$$\frac{\partial \phi}{\partial t} = \alpha \frac{\partial^2 \phi}{\partial x^2}$$

- Let's use the second-order central difference scheme to the second derivative.

$$\frac{d\phi_j}{dt} = \alpha \frac{\phi_{j+1} - 2\phi_j + \phi_{j-1}}{\Delta x^2}, \quad j = 1, 2, 3, \dots, N-1$$

Where  $\phi_j = \phi(x_j, t)$

- A system of  $N - 1$  ordinary differential equations

→ Space derivatives for fixed time ( $\rightarrow$  Semi-discretization) and solving time marching as solving ODEs.

→ Can be written in matrix form as:

$$\frac{d\phi}{dt} = A\phi$$

→ Where as  $\phi_j$  are the (time-dependent) elements of the vector  $\phi$ , and  $A$  is an  $(N - 1) \times (N - 1)$  tridiagonal matrix.

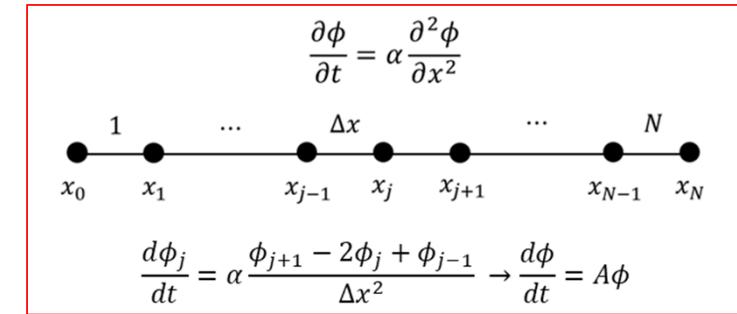

# Semi-discretization

$$A = \frac{\alpha}{\Delta x^2} \begin{bmatrix} -2 & 1 & \dots & & \\ 1 & -2 & 1 & & \\ \ddots & \ddots & \ddots & & \\ & 1 & -2 & & \end{bmatrix}$$

→  $(N - 1) \times (N - 1)$  tridiagonal matrix which is symmetric

- The result is a system of ODEs that can be solved using any of the numerical methods introduced for ODEs, such as Euler methods, RK formulas or multi-step methods.
- However, when dealing with systems, we should be concerned about stability.
- The range of the eigenvalues of  $A$  determines whether the system is stable.

$$A\phi = \lambda\phi \rightarrow \det(A - \lambda I) = 0$$

# Temporal discretization

$$A = \frac{\alpha}{\Delta x^2} \begin{bmatrix} -2 & 1 & \dots & \\ 1 & -2 & 1 & \\ \vdots & \vdots & \ddots & \\ 1 & -2 & & \end{bmatrix}$$

- **(Recall) Various time advancement schemes**

$$\frac{d\phi}{dt} = A\phi$$

- Forward Euler scheme

$$\frac{\phi^{(n+1)} - \phi^{(n)}}{\Delta t} = A\phi^{(n)}$$

- Backward Euler scheme

$$\frac{\phi^{(n+1)} - \phi^{(n)}}{\Delta t} = A\phi^{(n+1)}$$

- Crank-Nicolson scheme

$$\frac{\phi^{(n+1)} - \phi^{(n)}}{\Delta t} = A \left[ \frac{\phi^{(n+1)} + \phi^{(n)}}{2} \right]$$

# Stability analysis

- **Eigenvalue/Eigenvector analysis**
  - (Recall) Diagonalization, Eigenvalues,  $\Lambda$  & Eigenvectors(Eigenfunctions),  $X$ 
    - **Diagonalization (Decoupling)**
      - ✓ Suppose  $A$  has the eigenvalues (*i.e.*  $A$  is diagonalizable),

$$X^{-1}AX = \Lambda \rightarrow A = X\Lambda X^{-1}$$

$$\frac{d\phi}{dt} = A\phi \Rightarrow \frac{d\phi}{dt} = (X\Lambda X^{-1})\phi \Rightarrow X^{-1} \frac{d\phi}{dt} = \Lambda(X^{-1}\phi)$$

$$\frac{d(X^{-1}\phi)}{dt} = \Lambda(X^{-1}\phi) \Rightarrow \frac{d\psi}{dt} = \Lambda\psi, \quad \psi = X^{-1}\phi$$

$$\begin{aligned} \frac{d\psi_j}{dt} = \lambda_j \psi_j \Rightarrow \psi_j = c_j e^{\lambda_j t} \Rightarrow \psi = c_1 \begin{bmatrix} e^{\lambda_1 t} \\ 0 \\ \vdots \\ 0 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ e^{\lambda_2 t} \\ \vdots \\ 0 \end{bmatrix} + \cdots + c_{N-1} \begin{bmatrix} 0 \\ 0 \\ \vdots \\ e^{\lambda_{N-1} t} \end{bmatrix} \\ \psi = \sum_{j=1}^{N-1} c_j e^{\lambda_j t} \rightarrow \phi = X\psi \end{aligned}$$

# Stability analysis

- Analytical expressions of eigenvalues of the matrix  $A$

$$\lambda_j = \frac{\alpha}{\Delta x^2} \left( -2 + 2 \cos \frac{\pi j}{N} \right), \quad j = 1, 2, 3, \dots, N-1$$

- The eigenvalue with the smallest ( $j = 1$ ) and the largest magnitude ( $j = N - 1$ ) is:

$$\lambda_1 = \frac{\alpha}{\Delta x^2} \left( -2 + 2 \cos \frac{\pi}{N} \right), \quad \lambda_{N-1} = \frac{\alpha}{\Delta x^2} \left( -2 + 2 \cos \frac{\pi(N-1)}{N} \right)$$

→ For large,  $N$ , the Taylor series expansion for  $\cos \frac{\pi}{N}$  converges rapidly, and  $\cos \frac{\pi(N-1)}{N}$  converges to -1.

$$\cos \frac{\pi}{N} = 1 - \frac{1}{2!} \left( \frac{\pi}{N} \right)^2 + \frac{1}{4!} \left( \frac{\pi}{N} \right)^4 + \dots, \quad \cos \frac{\pi(N-1)}{N} \approx \cos \pi = -1$$

→ Using the first two terms in the expansion then,

$$\lambda_1 \approx -\frac{\pi^2 \alpha}{N^2 \Delta x^2},$$

$$\lambda_{N-1} \approx -4 \frac{\alpha}{\Delta x^2}$$

$$A = \frac{\alpha}{\Delta x^2} \begin{bmatrix} -2 & 1 & \cdots & & \\ 1 & -2 & 1 & & \\ \ddots & \ddots & \ddots & \ddots & \\ & 1 & -2 & & \end{bmatrix}$$

→  $(N - 1) \times (N - 1)$  tridiagonal matrix

$$A\phi = \lambda\phi \rightarrow \det(A - \lambda I) = 0$$

# Stability analysis

$$\lambda_1 \approx -4 \frac{\pi^2 \alpha}{N^2 \Delta x^2}, \quad \lambda_{N-1} \approx -4 \frac{\alpha}{\Delta x^2}$$

- The ratio of the eigenvalue with the largest modulus to that with the smallest modulus is :

$$\left| \frac{\lambda_{N-1}}{\lambda_1} \right| \approx \frac{4N^2}{\pi^2}$$

→ For large N, the system is unstable!

frequency : 1초당 진동수  
Wavenumber : wave의 숫자

# Stability analysis

- **Modified wavenumber analysis**      공간차분을 어떻게 하느냐에 대해서 결정됨

- Let revisit the heat equation,

$$\frac{\partial \phi}{\partial t} = \alpha \frac{\partial^2 \phi}{\partial x^2}$$

→ Assuming solution of the form  $\phi(x, t) = \psi(t)e^{ikx}$

$$\frac{d\psi}{dt} = -\alpha k^2 \psi$$

→ Applying to semi-discretized equation

$$\frac{d\phi_j}{dt} = \alpha \frac{\phi_{j+1} - 2\phi_j + \phi_{j-1}}{\Delta x^2}, \quad j = 1, 2, 3, \dots, N-1$$

$$\phi_j(x, t) = \psi(t)e^{ikx_j}$$

$$e^{ikx_j} \frac{d\psi_j}{dt} = \frac{\alpha}{\Delta x^2} [e^{ikx_j} e^{ik\Delta x} - 2e^{ikx_j} + e^{ikx_j} e^{-ik\Delta x}] \psi_j$$

$$\frac{d\psi_j}{dt} = \frac{\alpha}{\Delta x^2} [-2 + e^{ik\Delta x} + e^{-ik\Delta x}] \psi_j = -\frac{2\alpha}{\Delta x^2} [1 - \cos(k\Delta x)] \psi_j = -\alpha k'^2 \psi_j$$

Modified wavenumber  
 $k'^2 = \frac{2}{\Delta x^2} [1 - \cos(k\Delta x)]$

# Stability analysis

→  $-\alpha k'^2 = \lambda$

$$\psi' = \lambda\psi$$

→ Using the forward Euler for time advancement,

$$\frac{\psi_j^{(n+1)} - \psi_j^{(n)}}{\Delta t} = -\frac{2\alpha}{\Delta x^2} [1 - \cos(k\Delta x)] \psi_j^{(n)}$$

$$\Delta t \leq \frac{2}{|\lambda|} \Rightarrow \Delta t \leq \frac{2}{\left| \frac{2\alpha}{\Delta x^2} [1 - \cos(k\Delta x)] \right|}$$

→ Since,  $-1 \leq \cos(k\Delta x) \leq 1$ , the worst-case scenario is :

$$\Delta t_{max} = \frac{\Delta x^2}{2\alpha}$$

$$\frac{d\psi_j}{dt} = -\alpha k'^2 \psi$$
$$k'^2 = \frac{2}{\Delta x^2} [1 - \cos(k\Delta x)]$$

# Stability analysis

→ Crank-Nicolson method

$$\frac{\psi_j^{(n+1)} - \psi_j^{(n)}}{\Delta t} = -\alpha k'^2 \left[ \frac{\psi_j^{(n+1)} + \psi_j^{(n)}}{2} \right]$$

$$\left( 1 + \frac{\alpha k'^2}{2} \right) \psi^{(n+1)} = \left( 1 - \frac{\alpha k'^2}{2} \right) \psi^{(n)}$$

✓ For the stability analysis,

$$\psi^{(n+1)} = \sigma \psi^{(n)}$$

$$\text{Where } \sigma = \frac{\left( 1 - \frac{\alpha k'^2}{2} \right)}{\left( 1 + \frac{\alpha k'^2}{2} \right)} = \frac{1 - \frac{\alpha \Delta t}{\Delta x^2} [1 - \cos(k \Delta x)]}{1 - \frac{\alpha \Delta t}{\Delta x^2} [1 + \cos(k \Delta x)]} \Rightarrow |\sigma| \leq 1$$

→ Crank-Nicolson is **unconditionally stable**

$$\frac{d\psi_j}{dt} = -\alpha k'^2 \psi$$
$$k'^2 = \frac{2}{\Delta x^2} [1 - \cos(k \Delta x)]$$

# Stability analysis

→ Using backward Euler

$$\frac{d\psi_j}{dt} = -\alpha k'^2 \psi$$
$$k'^2 = \frac{2}{\Delta x^2} [1 - \cos(k\Delta x)]$$

$$\frac{\psi_j^{(n+1)} - \psi_j^{(n)}}{\Delta t} = -\alpha k'^2 \psi_j^{(n+1)}$$

$$\left(1 + \frac{\alpha k'^2}{2}\right) \psi^{(n+1)} = \psi^{(n)}$$

✓ For the stability analysis,

$$\psi^{(n+1)} = \gamma \psi^{(n)}$$

$$\text{Where } \gamma = \frac{1}{\left(1 + \frac{\alpha k'^2}{2}\right)} = \frac{1}{1 - \frac{\alpha \Delta t}{\Delta x^2} [1 + \cos(k\Delta x)]} \Rightarrow |\gamma| \leq 1$$

→ Backward Euler is **unconditionally stable**

✓ However, in contrast to Crank-Nicolson,  $\sigma \rightarrow 0$  when  $\Delta t \rightarrow \infty$ . That is, the solution does not exhibit undesirable oscillations (although it would be inaccurate).

# Stability analysis

- Consider the wave equation,

$$\frac{\partial u}{\partial t} + c \frac{\partial u}{\partial x} = 0, \quad 0 \leq x \leq L, \quad t \geq 0$$

→ Assuming,  $u(x, t) = v(t)e^{ikx}$

$$e^{ikx} \frac{dv}{dt} = -ikc(e^{ikx})v \Rightarrow \frac{dv}{dt} = -ikc v$$

Modified wavenumber  
 $k' = \frac{\sin(k\Delta x)}{\Delta x}$

→ Semi-discretized equation with central difference scheme,

$$\frac{du_j}{dt} + c \frac{u_{j+1} - u_{j-1}}{2\Delta x} = 0 \Rightarrow \frac{dv_j}{dt} = -ic \frac{\sin(k\Delta x)}{\Delta x} v_j = -ick' v_j$$

# Stability analysis

- **von Neumann stability analysis**

- Matrix stability analysis using the eigenvalues of the matrix obtained from a semi-discretization of PDE
  - This is only available for very simple matrices
- Consider **full discretization** of PDE
  - von Neumann stability analysis does not account for the effect of boundary conditions; periodic boundary conditions are assumed.
  - Linear, constant coefficient differential equations with uniformly spaced spatial grids.

$$\frac{\partial \phi}{\partial t} = \alpha \frac{\partial^2 \phi}{\partial x^2}$$

- Second-order central difference with the explicit Euler method

$$\frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} = \alpha \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2}$$

- Assuming a solution of the form

$$\phi_j^{(n)} = \sigma^n e^{ikx_j}$$

# Stability analysis

$$\frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} = \alpha \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2}$$
$$\phi_j^{(n)} = \sigma^n e^{ikx_j}$$

$$\phi_j^{(n+1)} = \phi_j^{(n)} + \frac{\alpha \Delta t}{\Delta x^2} (\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)})$$

$$\sigma^{n+1} e^{ikx_j} = \sigma^n e^{ikx_j} + \frac{\alpha \Delta t}{\Delta x^2} \sigma^n (e^{ikx_{j+1}} - 2e^{ikx_j} + e^{ikx_{j-1}})$$

Where  $x_{j+1} = x_j + \Delta x$  and  $x_{j-1} = x_j - \Delta x$ .

$$\sigma = 1 + \left( \frac{\alpha \Delta t}{\Delta x^2} \right) [2 \cos(k \Delta x) - 2]$$

For stability,  $|\sigma| \leq 1$

$$\left| 1 + \left( \frac{\alpha \Delta t}{\Delta x^2} \right) [2 \cos(k \Delta x) - 2] \right| \leq 1$$

$$\left( \frac{\alpha \Delta t}{\Delta x^2} \right) [2 \cos(k \Delta x) - 2] \geq -2 \quad \rightarrow \quad \Delta t \leq \frac{\Delta x^2}{\alpha [1 - \cos(k \Delta x)]}$$

The worst (or the most restrictive) case occurs when  $\cos(k \Delta x) = -1$ .

$$\Delta t \leq \frac{\Delta x^2}{2\alpha}$$

# Accuracy via modified equation

- Second-order central difference with the explicit Euler method :

$$\frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} = \alpha \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2}$$

Goal!

$$\frac{\partial \phi}{\partial t} = \alpha \frac{\partial^2 \phi}{\partial x^2}$$

해석하기!

- Define the numerical operator as:

$$L[\phi_j^{(n)}] = \frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} - \alpha \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2},$$

RHS 항처럼 만드는 operator.

1                          2

$\Theta \downarrow$  수동적 미분  
자연적 미분

$\Theta$                           L[ $\phi_j$ ] = 0                          \* Error를 줄이고 싶어.

- Consider the Taylor's expansion,

$$1 \quad \phi_j^{(n+1)} = \phi_j^{(n)} + \Delta t \frac{\partial \phi_j^{(n)}}{\partial t} + \frac{\Delta t^2}{2!} \frac{\partial^2 \phi_j^{(n)}}{\partial t^2} + \dots \Rightarrow \frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} = \frac{\partial \phi_j^{(n)}}{\partial t} + \frac{\Delta t}{2!} \frac{\partial^2 \phi_j^{(n)}}{\partial t^2} + \dots$$

$$2 \quad \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2} = \left. \frac{\partial^2 \phi^{(n)}}{\partial x^2} \right|_j + \frac{\Delta x^2}{2 \cdot 3!} \left. \frac{\partial^4 \phi^{(n)}}{\partial x^4} \right|_j + \dots$$

## Accuracy via modified equation

- By 1 -  $\alpha$  2 ,

$$L[\phi_j^{(n)}] = \frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} - \alpha \frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2}$$

$$\frac{\phi_j^{(n+1)} - \phi_j^{(n)}}{\Delta t} = \frac{\partial \phi_j^{(n)}}{\partial t} + \frac{\Delta t}{2!} \frac{\partial^2 \phi_j^{(n)}}{\partial t^2} + \dots$$

$$\frac{\phi_{j+1}^{(n)} - 2\phi_j^{(n)} + \phi_{j-1}^{(n)}}{\Delta x^2} = \left. \frac{\partial^2 \phi^{(n)}}{\partial x^2} \right|_j + \frac{\Delta x^2}{2 \cdot 3!} \frac{\partial^4 \phi^{(n)}}{\partial x^4} + \dots$$

$$L[\phi_j^{(n)}] - \left( \frac{\partial \phi_j^{(n)}}{\partial t} - \alpha \frac{\partial^2 \phi_j^{(n)}}{\partial x^2} \right) = -\alpha \frac{\Delta x^2}{12} \frac{\partial^4 \phi^{(n)}}{\partial x^4} + \frac{\Delta t}{2} \frac{\partial^2 \phi_j^{(n)}}{\partial t^2} + \dots$$

$$L[\phi] - \left( \frac{\partial \phi}{\partial t} - \alpha \frac{\partial^2 \phi}{\partial x^2} \right) = -\alpha \frac{\Delta x^2}{12} \frac{\partial^4 \phi}{\partial x^4} + \frac{\Delta t}{2} \frac{\partial^2 \phi}{\partial t^2} + \dots \Rightarrow \frac{\partial \phi}{\partial t} - \alpha \frac{\partial^2 \phi}{\partial x^2} = \alpha \frac{\Delta x^2}{12} \frac{\partial^4 \phi}{\partial x^4} - \frac{\Delta t}{2} \frac{\partial^2 \phi}{\partial t^2} + \dots$$

헷갈리

- Let  $\tilde{\phi}$  be the exact solution for  $\frac{\partial \tilde{\phi}}{\partial t} = \alpha \frac{\partial^2 \tilde{\phi}}{\partial x^2}$ ,

헷갈리  $\rightarrow$  예제!

$$L[\tilde{\phi}] = \varepsilon$$

practical BDFII 사용하길 희망

$$\varepsilon = -\alpha \frac{\Delta x^2}{12} \frac{\partial^4 \tilde{\phi}}{\partial x^4} + \frac{\Delta t}{2} \frac{\partial^2 \tilde{\phi}}{\partial t^2} + \dots = \left( -\alpha \frac{\Delta x^2}{12} + \alpha^2 \frac{\Delta t}{2} \right) \frac{\partial^4 \tilde{\phi}}{\partial x^4} + \dots \quad \leftarrow \quad \frac{\partial^2 \tilde{\phi}}{\partial t^2} = \alpha \frac{\partial^3 \tilde{\phi}}{\partial t \partial x^2} = \alpha^2 \frac{\partial^4 \tilde{\phi}}{\partial x^4}$$

- Let set CFL number as:

$$\text{error} = 0.03 \Rightarrow \frac{\alpha \Delta t}{\Delta x^2} = \frac{1}{6}$$

Special case.

$\rightarrow$  Then, significantly increase the accuracy of method.

$\rightarrow$  Recall) For stability,  $CFL \leq 1/2$

오일러 Explicit method 허용

1/4와 적기만 하면 됨.

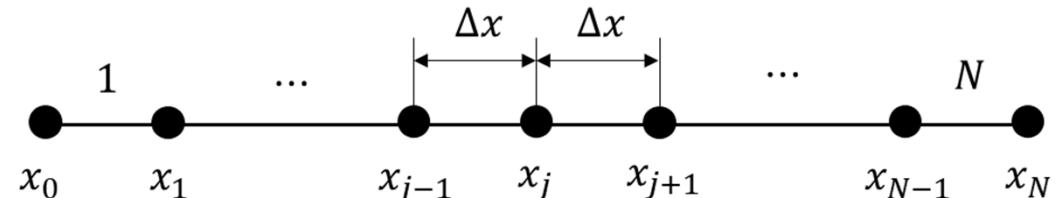

## Example 1

- Consider the (unsteady) heat equation (or 1D diffusion equation) given by:

$$\frac{\partial T}{\partial t} = \alpha \frac{\partial^2 T}{\partial x^2} + (\pi^2 - 1)e^{-t} \sin \pi x \quad \begin{matrix} 0 \leq x \leq 1 \\ t \geq 0 \end{matrix}$$

Solution은 여기에 의존

- Initial conditions:  $T(x, 0) = \sin \pi x$
- Boundary conditions :  $T(0, t) = T(1, t) = 0$
- Assume  $\alpha = 1$  and  $\Delta x = 0.05$ ,  $N = 21$
- $x_j = x_{j-1} + \Delta x$

- Discretized equation:

$$\left. \frac{dT}{dt} \right|_j = \alpha \left( \frac{T_{j+1} - 2T_j + T_{j-1}}{\Delta x^2} \right) + f_j, \quad j = 1, 2, 3, \dots, N-1$$
$$f_j = (\pi^2 - 1)e^{-t} \sin \pi x_j$$

# Example 1

- Discretized equation:

$$\frac{dT}{dt} \Big|_j = \underbrace{\alpha \left( \frac{T_{j+1} - 2T_j + T_{j-1}}{\Delta x^2} \right)}_F + f_j, \quad j = 1, 2, 3, \dots, N-1$$
$$A = \frac{\alpha}{\Delta x^2} \begin{bmatrix} -2 & 1 & \dots & & \\ 1 & -2 & 1 & & \\ & \ddots & \ddots & \ddots & \\ & & 1 & -2 & \end{bmatrix} \Rightarrow \begin{aligned} \frac{dT}{dt} \Big|_1 &= \frac{\alpha}{\Delta x^2} (T_2 - 2T_1) + (\pi^2 - 1)e^{-t} \sin \pi x_1 \\ \frac{dT}{dt} \Big|_2 &= \frac{\alpha}{\Delta x^2} (T_3 - 2T_2 + T_1) + (\pi^2 - 1)e^{-t} \sin \pi x_2 \\ &\vdots \end{aligned}$$

- The PDE has been converted to a system of ODEs
- Time advancement
- Using forward Euler,

$$T_j^{(n+1)} = T_j^{(n)} + \Delta t F(T_j^{(n)}, t_n)$$

## Example 1

- The stability of the numerical solution for time advancement depends on the eigenvalue of the system having the largest magnitude:

$$\lambda_{N-1} \approx -4 \frac{\alpha}{\Delta x^2}$$

→ When forward Euler is used for real and negative  $\lambda$ :

$$\Delta t_{max} = \frac{2}{|\lambda|_{max}} = \frac{\Delta x^2}{2\alpha}$$

→ For  $\alpha = 1$  and  $\Delta x = 0.05$ ,

$$\Delta t_{max} = 0.00125$$

# Example 1

- Pseudo-code & Code

```
Program solve_heat_eq
x0 ← 0, xmax ← 1
t0 ← 0, nt ← 2000
dt ← 0.001, dx ← 0.05
T ← sin πx
T[0], T[xmax] ← 0, 0

Call Euler(t, T, nt, dt, heateq, x, dx)
End program

Function Euler(t0, y0, nt, dt, f, x, dx)
y = y0

for i = 0 to nt - 1 do
    t = t0 + (i + 1)dt
    rhs ← f(y, t, x, dx)
    y = y + rhs * dt
end for
return t, y
End function

Function heateq(T, t, x, dx)
alpha ← 1
source ← (π2 - 1)e-tsin πx

dudti ←  $\frac{(T_{i+1} - 2T_i + T_{i-1})}{dx^2} + source_i$ 
return dudt
End function
```

```
x0 = 0
xmax = 1

t0 = 0
nt = 2001
dt = 0.001
dx = 0.05
nx = int((xmax-x0)/dx + 1)

x = np.linspace(x0, xmax, nx)

# initial condition
T = np.sin(np.pi * x)
# boundary condition
T[0], T[-1] = 0, 0

# solve Heat Equation
t = t0

t,T= Euler(t,T,nt,dt,heateq,x,dx)
```

```
def heateq(T,t,x,dx):
    alpha = 1
    dudt = np.zeros(len(T))

    source = (np.pi**2 -1)*np.exp(-t)*np.sin(np.pi*x)
    #central difference
    dudt[1:-1] = (T[:-2] - 2*T[1:-1] + T[2:])/dx**2 +source[1:-1]

    return dudt

def Euler(t0, y0, nt, dt, f, x, dx):
    y = y0

    for i in range(nt):
        t = t0 + dt*(i+1)

        rhs = f(y,t,x,dx)

        y = y + dt*rhs

    return t,y
```

# Example 1

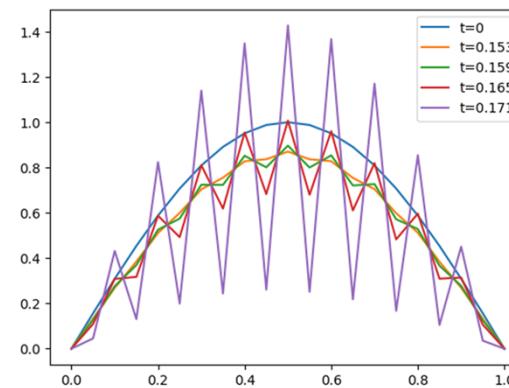

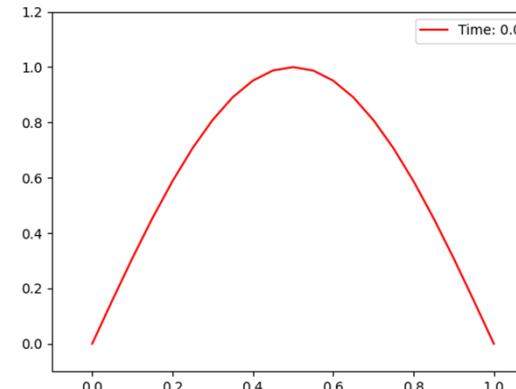

→ For  $\alpha = 1$  and  $\Delta x = 0.05$ ,  
 $\Delta t_{max} = 0.00125$

- **result**

- $\Delta t = 0.001, \Delta x = 0.05, \alpha = 1$

- $\Delta t = 0.0015, \Delta x = 0.05, \alpha = 1$

dissipation : 에너지가 점점 없어짐  
dispertion : 에너지가 점점 흩어짐.

→ 시간이 지나도 모양이 변하지 않아야 함.

## 1D Wave equation

dissipation 되는 성질이 있음.

- Consider a semi-discretization of the following first-order wave equation :

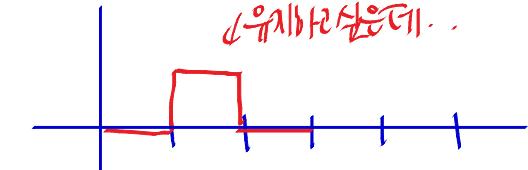

→ aka the convection/transport equation

$$\frac{\partial u}{\partial t} + c \frac{\partial u}{\partial x} = 0$$

Initial condition :  $u(x, 0) = f(x)$

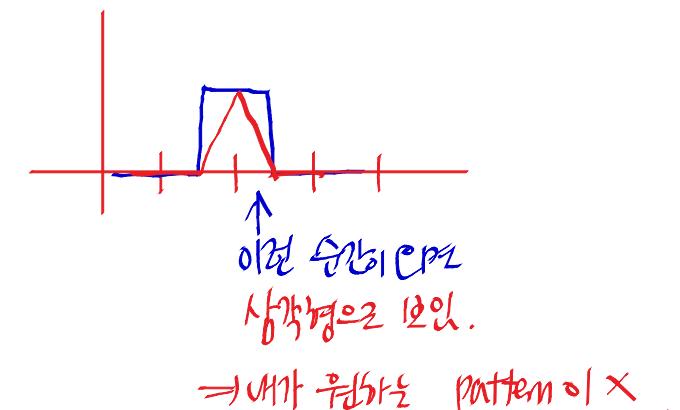

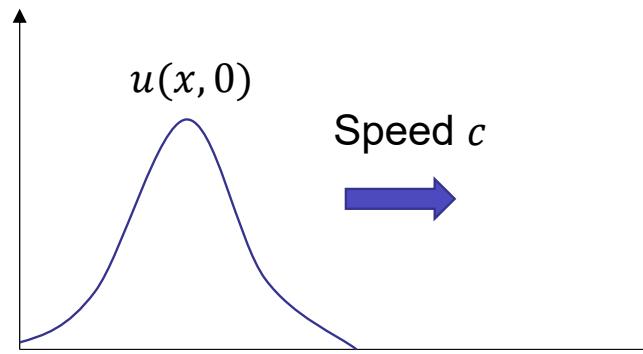

Boundary condition :  $u(0, t) = \phi(L, t) = 0$

차분화 할 때, 그때로 모양이  
나타워하는 경자위치가  
없을 수도 있잖아?!  
그래서 어렵다. (FDM),

→ A simple model equation for the convection phenomena.

→ The exact solution is such that an initial disturbance in the domain ( $u(x, 0)$ ) simply propagates with the constant convection speed  $c$  in the positive (or negative)  $x$ -direction.

# Semi-discretization

$$\frac{\partial u}{\partial t} + c \frac{\partial u}{\partial x} = 0$$

- Semi-discretization

→ Assume  $c > 0$ , and using central difference scheme,

$$\frac{du_j}{dt} + c \frac{u_{j+1} - u_{j-1}}{2\Delta x} = 0$$

← 시그마에 대한 차운 X,  
파이에 대한 차운 0.  
⇒ System of ODE 가  $\leq h$ .

→ In matrix form,

$$\frac{du}{dt} = Au$$

where  $A = -\frac{c}{2\Delta x} \begin{bmatrix} 0 & 1 & \cdots & & \\ -1 & 0 & 1 & & \\ & \ddots & \ddots & \ddots & \\ & & -1 & 0 & \end{bmatrix}$  →  $(N - 1) \times (N - 1)$  tridiagonal matrix which is **not symmetric**

- ✓ From analytical consideration, **no boundary condition is prescribed at  $x = L$** .
- ✓ However, a special **numerical boundary treatment** is required at  $x = L$  owing to the use of central differencing in this problem.
- ✓ A typical well-behaved numerical boundary treatment at  $x = L$  slightly **modifies the last row of the coefficient matrix  $A$** , but we will ignore it for now.

# Stability analysis

$$A = -\frac{c}{2\Delta x} \begin{bmatrix} 0 & 1 & \cdots \\ -1 & 0 & 1 \\ \ddots & \ddots & \ddots \\ & -1 & 0 \end{bmatrix}$$

$\rightarrow (N-1) \times (N-1)$  tridiagonal matrix

- **Modified wavenumber analysis**

- The eigenvalues of  $A$  are :

↑ Stability가 증명되는  
이미 cos of oscillational point

$$\lambda_j = -\frac{c}{\Delta x} \left( i \cos \frac{\pi j}{N} \right), \quad j = 1, 2, 3, \dots, N-1$$

- Thus, the eigenvalues of the matrix resulting from semi-discretization of the convection equation are purely imaginary

↑ Upwind

$$\lambda_j = i\omega_j, \quad \text{where } \omega_j = -\frac{c}{\Delta x} \left( \cos \frac{\pi j}{N} \right)$$

↑ 비선형 문제 방정식의  
balanced 된 stability 입니다.  
제시 않아서 그냥 upwind 입니다.

- The solution is a superposition of modes, where each mode's temporal behavior is given by  $e^{i\omega_j t}$

- Oscillatory or sinusoidal(non-decaying) character.

# Stability analysis

→ Leap flog method for time advancement,

$$\frac{v_j^{(n+1)} - v_j^{(n-1)}}{2\Delta t} = -ic \frac{\sin(k\Delta x)}{\Delta x} v_j^{(n)}$$

$$\Delta t \leq \frac{1}{k'c} = \frac{\Delta x}{c \sin(k\Delta x)}$$

✓ The worst-case scenario is,

$$\Delta t_{max} \leq \frac{\Delta x}{c} \left( \begin{array}{l} \text{CFL} \leq 2.83 \\ \Delta t_{max} = \frac{\Delta x}{c} \end{array} \right)$$

→ Courant, Friedrich and Lewy (CFL) number is defined:

- 굉장히 적설적인 number of.

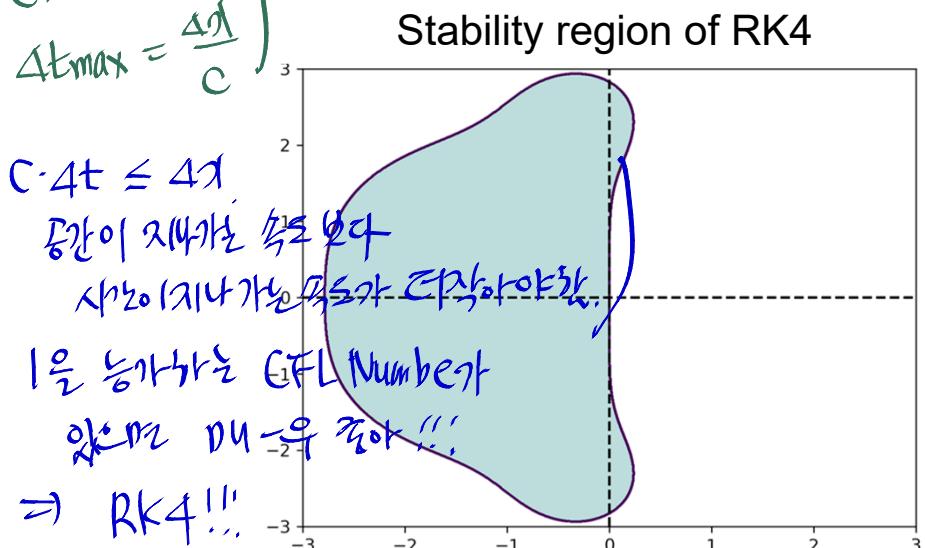

→ RK4

implicit method 를 사용

예를 들어 ) m/s 의 관리가 있을 때

1초 Sampling 한다면 2초까지는 끝나고

$$CFL \leq 2.83$$

$$\frac{dv_j}{dt} = -ick'v_j$$

$$k' = \frac{\sin(k\Delta x)}{\Delta x}$$

## Example 2

- Consider the numerical solution to the homogeneous convection equation

$$\frac{\partial u}{\partial t} + c \frac{\partial u}{\partial x} = 0 \quad \begin{matrix} 0 \leq x \leq L \\ t \geq 0 \end{matrix}$$

- Initial conditions:  $u(x, 0) = e^{-200(x-0.25)^2}$
- Boundary conditions:  $u(0, t) = 0$
- Although the proper spatial domain for this PDE is semi-infinite, numerical implementation requires a finite domain.
- Thus, we arbitrarily truncate the domain to  $0 \leq x \leq 1$
- Semi-discretized equation using a 2<sup>nd</sup> order central difference scheme:

$$\frac{du_i}{dt} + c \frac{u_{j+1} - u_{j-1}}{2\Delta x} = 0$$

# Example 2

- Pseudo-code & Code

```
